Office Action Summary

Application No.

10/728,370

Applicant(s)

DARLING ET AL.

Examiner

Mary J. Steelman

Art Unit

2191

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 20 January 2006.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-26 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-26 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

1. This Office Action is in response to Remarks and Amendments received 20 January 2006. Per Applicant's request, claims 1, 2, 3, 5, 6, 7, 9, 12-17, 19, 20, 21, 23, and 26 have been amended. Claims 1-26 are pending.

Specification

2. In view of the amendments to the Specification, the prior objections are hereby withdrawn.

Drawings

3. In view of the amendments to the Specification, the prior objections are hereby withdrawn.

Response to Arguments

4. Applicant has argued, in substance, the following:

(A) Regarding independent claim 1, as noted at the bottom of page 11, Broman "does not teach or disclose a system wherein a module can provide and use at least one API." Applicant argues that the Office Action has incorrectly correlated the term 'user interface components' with APIs.

Examiner's Response: Examiner disagrees. The fact that user interface components exist in an application implies that they are used by Application Programming Interface code to communicate with program functionality. Broman disclosed (col. 2, line 66) a custom application project generator, that creates source file templates and user interface resources. Col. 3, lines 28-35, the custom application project generator interfaces (application programming

interface functionality) with a generator services module. The generator services module provides services for basic user interface and application project generation functionality. Col. 3, line 33, “The custom application project generator and standard services module are **interfaced by a framework which comprises a set of application program interfaces included in the standard services module and a set of class interfaces included in the custom application project generator.**” (emphasis added)

(B) Regarding independent claim 1, as noted at the middle of page 12, Broman “does not teach or suggest a system that gathers application program interface (API) dependency information for each module.”

Examiner’s Response: Thurston, more specifically disclosed metadata [0008-0009] to control installations and dependency information placed into ‘constraints’ that must be satisfied into a header. See FIG. 4. Thurston disclosed ‘metadata’ held in header files [0039-0041], including version number, names of dependent devices, size and checksums, and digital signature.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Art Unit: 2191

6. Claims 1-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over US Patent 5,754,858 to Broman et al., in view of US Patent Application Publication 2003/0217193 A1 to Thurston et al.

Per claim 1:

A method of a development and build environment for packaged software delivery in a distributed network of nodes, the method comprising the computer-implemented steps of:
Broman disclosed a 'method' (col. 23, line 31-col. 24, line 40) for "customizable automated application project generation (col. 4, lines 65-66) (development and build environment).
Broman disclosed the 'network' suitability at col. 20, lines 52-63.

-compiling source code files into executable file modules;

Broman disclosed compiling source code at col. 6, lines 20-22, "The writer builds...from the source files...using a compiler..."

-wherein a module contains an image for a process or a dynamically linked library (DLL);

Broman disclosed dynamically linked libraries at col. 6, lines 27-32, "...links the object code...and .RES files together into a dynamic link library..."

-creating a software package that comprises at least one module;

Broman disclosed (Col. 6, lines 36-37) the custom application project generator creating the application project (software package comprising at least one module).

-wherein packages are created based on features/characteristics or purpose;

Broman disclosed, as an example, (col. 8, lines 5-10) the package may be language specific (feature / characteristic / purpose).

-creating metadata for a module that includes any module information such as the module's: binary signature, name, directory path, and characteristics;

Broman disclosed (col. 7, line 55), as an example, a 'name' may be created. Also, col. 11, lines 47-54, disclosed a services module generates a file named by destination-filename (name) which can contain a path (directory path).

-inserting the module's metadata into the software package;

Broman disclosed a 'newproj.inf' template (col. 11, line 39) that contains created directories, whereby the directories are filled by the services module (col. 11, line 49). The services module lists files used to build the application (col. 11, lines 60-67).

-gathering application program interface (API) dependency information for each module;

Broman disclosed (col. 8, lines 25-28 & 44-45) a services module that presents a sequence of options for selection, suggestive of dependency compliance. A set of user interface controls for the user to choose from related applications project options. Col. 3, line 33, "The custom application project generator and standard services module are **interfaced by a framework which comprises a set of application program interfaces included** in the standard services

Art Unit: 2191

module **and a set of class interfaces included** in the custom application project generator.”

(emphasis added)

-wherein a module can provide and use at least one API;

Broman disclosed providing and using APIs, (col. 8, lines 38-48), as an example, the project generator and services module generate using templates (resource files – text or binary), where the binary files contain user interface components (toolbars and the like) which inherently communicate with the underlying program through APIs. At col. 8, line 10, a ‘list box’ control is used to select specific language support. Inherently there are Application Programming Interface functions that link (use at least one API) to the desired language module. Also, col. 17, line 24, API functions support language selection. Col. 3, line 33, “The custom application project generator and standard services module are **interfaced by a framework which comprises a set of application program interfaces included** in the standard services module **and a set of class interfaces included** in the custom application project generator.” (emphasis added)

Regarding the limitations:

-collecting dependencies documented in module specifications...;

Broman disclosed (col. 10, line 30) application project options, suggestive of dependencies.

Also Broman disclosed (col. 11, lines 63-67) make files which list source code files that must be compiled (considering dependencies) to build the application.

-wherein the dependencies documented in each module lists API names and versions that the process or DLL depends on.

Broman disclosed (col. 17, lines 1-24) template processing directives for the document where the module build inherently includes API names and versions (bitmap data for user interface components copied into the project-col. 8, lines 38-48)

Broman disclosed 'dependency' information, but failed to disclose 'metadata'.

However, Thurston, more specifically disclosed metadata [0008-0009] to control installations and dependency information placed into 'constraints' that must be satisfied into a header. See FIG. 4. Thurston disclosed 'metadata' held in header files [0039-0041], including version number, names of dependent devices, size and checksums, and digital signature.

Therefore, it would have been obvious, to one of ordinary skill in the art, at the time of the invention to modify Broman's invention to include additional details in the component header such as names, versions, and dependency constraints, as disclosed by Thurston, because such information contained in a header file as meta data is useful for conveying relevant information when delivering software for installation. Thurston was motivated (Thurston-[0010]) to provide updates to support new and different types of devices in a manner to simplify development and maintenance. It would have been obvious, to one of ordinary skill in the art, at the time of the invention to modify Broman / Thurston, using Kramer, because Kramer provided support for software development [0004], allowing developers to maintain control the module dependency

Art Unit: 2191

structure in a pragmatic, cost effective way over the long lifetime of large-scale, development and maintenance projects.

Per claim 2:

-a linker creates a list of dependent modules for a given process or DLL module and places the list....

Broman disclosed a linker. See FIG. 2, #72 & #88. Broman disclosed (col. 8, lines 5-10 & 25-28) selectable option steps and selectable language resources, disclosing consideration to dependencies. The services module copies (col. 11, lines 55-60) template information to the project. Col. 11, lines 63-67, disclosed a 'make file' which lists source code files that must be compiled to build (list of dependent modules for a given process) the application.

Broman disclosed 'dependency' information, and failed to disclose placing information into the 'metadata'.

However, Thurston, more specifically disclosed metadata [0008-0009] to control installations and dependency information placed into 'constraints' that must be satisfied into a header. See FIG. 4. Thurston disclosed 'metadata' held in header files [0039-0041], including version number, names of dependent devices, size and checksums, and digital signature.

Therefore, it would have been obvious, to one of ordinary skill in the art, at the time of the invention to modify Broman's invention to include additional details of metadata in the component header, as disclosed by Thurston, because such information contained in a header file

Art Unit: 2191

as metadata is useful for conveying relevant information when delivering software for installation. Thurston was motivated (Thurston –[0010]) to provide updates to support new and different types of devices in a manner to simplify development and maintenance.

Per claim 3:

-creating metadata for each API;

Broman disclosed (col. 9, lines 20-55) that a user is presented with options for creating an application project. The project generator and services module generate the application project using the template files / resource files. Template files / resource files contain text and binary files and macros and directives, which determine the content of the source files in the application project (provides metadata type information). Broman disclosed (col. 10, lines 3-12 & 31-33) ‘directives’ guide the production of the application project, through a confirm.inf template.

-inserting the API metadata into the software package;

Broman disclosed (col. 11, lines 17-21) “The newproj.inf template contain the instructions (metadata type information inserted into package) that the services module uses to construct the application project. The instructions are statements, directives, and macros that work together to describe the structure of the application project.”

Regarding the limitation:

-wherein metadata for an API includes, but is not limited to: the API's name and version.

Art Unit: 2191

Broman was suggestive of metadata included in the created application project, but failed to explicitly disclose metadata and contents. However Thurston disclosed metadata stored in a header portion [0008-0009] to be used to control installation of code. Thurston disclosed the header data could include a name, version, size, checksum, digital signature.

Therefore, it would have been obvious, to one of ordinary skill in the art, at the time of the invention to modify Broman's invention to include additional details of metadata in the component header, as disclosed by Thurston, because such information contained in a header file as metadata is useful for conveying relevant information when delivering software for installation. Thurston was motivated (Thurston –[0010]) to provide updates to support new and different types of devices in a manner to simplify development and maintenance.

Per claim 4:

Bronson failed to disclose:

- calculating a binary signature for each module and inserting the binary signature into the respective module's metadata;
- wherein each unique version of a module will have a unique binary signature.

However Thurston disclosed metadata stored in a header portion [0008-0009] to be used to control installation of code. Thurston disclosed the header data could include a name, version, size, checksum, digital signature (binary signature). Details including name, version, size, checksum contribute to a unique binary signature.

Therefore, it would have been obvious, to one of ordinary skill in the art, at the time of the invention to modify Broman's invention to include additional details of metadata in the component header, as disclosed by Thurston, because such information contained in a header file as metadata is useful for conveying relevant information when delivering software for installation. Thurston was motivated (Thurston –[0010]) to provide updates to support new and different types of devices in a manner to simplify development and maintenance.

Per claim 5:

Bronson failed to specifically disclose:

- creating metadata for a package that includes any package information such as the package's: name, build date, and characteristics;
- inserting the package metadata into the package.

However Thurston disclosed metadata stored in a header portion (inserting package metadata) [0008-0009] to be used to control installation of code. Thurston disclosed the header data could include a name, version, size, checksum, digital signature (binary signature). Details including name, version (build date), size, checksum (characteristics) contribute to a unique identity.

Therefore, it would have been obvious, to one of ordinary skill in the art, at the time of the invention to modify Broman's invention to include additional details of metadata in the component header, as disclosed by Thurston, because such information contained in a header file

Art Unit: 2191

as metadata is useful for conveying relevant information when delivering software for installation. Thurston was motivated (Thurston –[0010]) to provide updates to support new and different types of devices in a manner to simplify development and maintenance.

Per claim 6:

A method of a development and build environment for packaged software delivery in a distributed network of nodes, the method comprising the computer-implemented steps of:

- compiling source code files into executable file modules;
- wherein a module contains an image for a process or a dynamically linked library (DLL);
- creating a software package that comprises at least one module;
- creating metadata for a module that includes any module information such as the module's: binary signature, name, directory path, and characteristics;
- inserting the module's metadata into the software package;
- gathering application program interface (API) dependency information for each module;
- wherein a module can provide and use at least one API.

See rejection of limitations as addressed in claim 1 above.

Per claim 7:

- wherein a linker creates a list of dependent modules for a given process or DLL module and places the list in the module's metadata.

Art Unit: 2191

See rejection of limitations as addressed in claim 2 above.

Per claim 8:

- collecting dependencies documented in module specifications and placing them into the module's metadata;

- wherein the dependencies documented in each module lists API names and versions that the process or DLL depends on.

See rejection of limitations as addressed in claim 1 above.

Per claim 9:

- creating metadata for each API;

- inserting the API metadata into the software package;

- wherein metadata for an API includes, but is not limited to: the API's name and version.

See rejection of limitations as addressed in claim 3 above.

Per claim 10:

- calculating a binary signature for each module and inserting the binary signature into the respective module's metadata;

- wherein each unique version of a module will have a unique binary signature.

See rejection of limitations as addressed in claim 4 above.

Per claim 11:

Art Unit: 2191

-packages are created based on features/characteristics or purpose.

See rejection of limitations as addressed in claim 1 above.

Per claim 12:

-creating metadata for a package that includes any package information such as the package's:
name, build date, and characteristics;

-inserting the package metadata into the package.

See rejection of limitations as addressed in claim 5 above.

Per claim 13:

An apparatus for a development and build environment for packaged software delivery in a
distributed network of nodes, comprising:

Bronson disclosed a 'system' (apparatus) (col. 4, lines 64-66) providing an automated
application project generation (a development and build environment).

-means for compiling source code files into executable file modules;

-wherein a module contains an image for a process or a dynamically linked library (DLL);

-means for creating a software package that comprises at least one module;

-means for creating metadata for a module that includes any module information such as the
module's: binary signature, name, directory path, and characteristics;

-means for inserting the module's metadata into the software package;

Art Unit: 2191

-means for gathering application program interface (API) dependency information for each module;

-wherein a module can provide and use at least one API.

See rejection of limitations as addressed in claim 1 above.

Per claim 14:

-a linker;

-wherein said linker creates a list of dependent modules for a given process or DLL module and places the list in the module's metadata.

See rejection of limitations as addressed in claim 2 above.

Per claim 15:

-means for collecting dependencies documented in module specifications and placing them into the module's metadata;

-wherein the dependencies documented in each module lists API names and versions that the process or DLL depends on.

See rejection of limitations as addressed in claim 1 above.

Per claim 16:

-means for creating metadata for each API;

-means for inserting the API metadata into the software package;

-wherein metadata for an API includes, but is not limited to: the API's name and version.

Art Unit: 2191

See rejection of limitations as addressed in claim 3 above.

Per claim 17:

-means for calculating a binary signature for each module and inserting the binary signature into the respective module's metadata;

-wherein each unique version of a module will have a unique binary signature.

See rejection of limitations as addressed in claim 4 above.

Per claim 18:

-packages are created based on features/characteristics or purpose.

See rejection of limitations as addressed in claim 1 above.

Per claim 19:

-means for creating metadata for a package that includes any package information such as the package's: name, build date, and characteristics;

-means for inserting the package metadata into the package.

See rejection of limitations as addressed in claim 5 above.

Per claim 20:

A computer-readable medium carrying one or more sequences of instructions for a development and build environment for packaged software delivery in a distributed network of nodes, which

Art Unit: 2191

instructions, when executed by one or more processors, cause the one or more processors to carry out the steps of:

- compiling source code files into executable file modules;
- wherein a module contains an image for a process or a dynamically linked library (DLL);
- creating a software package that comprises at least one module;
- creating metadata for a module that includes any module information such as the module's: binary signature, name, directory path, and characteristics;
- inserting the module's metadata into the software package;
- gathering application program interface (API) dependency information for each module;
- wherein a module can provide and use at least one API.

This is a 'computer readable medium' version of claim 1. See FIG. 2 where the instructions for development are shown located on a system. See rejection of limitations as addressed in claim 1 above.

Per claim 21:

- wherein a linker creates a list of dependent modules for a given process or DLL module and places the list in the module's metadata.

See rejection of limitations as addressed in claim 2 above.

Per claim 22:

Art Unit: 2191

-collecting dependencies documented in module specifications and placing them into the module's metadata;

-wherein the dependencies documented in each module lists API names and versions that the process or DLL depends on.

See rejection of limitations as addressed in claim 1 above.

Per claim 23:

-creating metadata for each API;

-inserting the API metadata into the software package;

-wherein metadata for an API includes, but is not limited to: the API's name and version.

See rejection of limitations as addressed in claim 3 above.

Per claim 24:

-calculating a binary signature for each module and inserting the binary signature into the respective module's metadata;

-wherein each unique version of a module will have a unique binary signature.

See rejection of limitations as addressed in claim 4 above.

Per claim 25:

-packages are created based on features/characteristics or purpose.

See rejection of limitations as addressed in claim 1 above.

Art Unit: 2191

Per claim 26:

-creating metadata for a package that includes any package information such as the package's name, build date, and characteristics; and inserting the package metadata into the package.

See rejection of limitations as addressed in claim 5 above.

Conclusion

7. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the mailing date of this final action.

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Note: US Patent Application Publication 2004/0133875 A1 to Kramer

Kramer disclosed [0032] a “rules-based module architecture checking system for compliance checking to monitor dependencies between software components. Also see Kramer, FIG. 3.
